On top of the hill S. of the Q.lda. near the El Cuzco. The local name is Cerro St. Jacinto white on the top says it is Cerro El Pichillo. From the limestone, as here I am, on the E. edge of the summit, you can look down into the newly cleared Maui Piza. Off to the W. of the St. Jacinto, in an area that was not cleared in 1995 + 2000, the land seems to flatten out - this may be the location of the hill.

El Cuzco is covered in redwood, high to high then south - hard to tell that there's a site here at all.

Here are the guys who were clearing the site, reporting that the land here is good for maize but can be used to plant for 1-1 1/2 years before fallowing, for about 1 yr.

The hill & the land N. of it to the Q.lda. area belongs to Capitán who, I believe, owned it over the past 2 years at least. He's building a wall concrete swimming pool & changing 5 of the old rd. S. of the area. From the west of the land is used for cattle pasture though there's a fellow (worked for me last yr.) who's planting the new hill face in corn using the double shank heavy plow, in 30-40' deep, current.

We walked over what we could of the path of the hill that overlooks the site from the S. St. Jacinto overgrown in high (over 6') mounds no visibility was very poor. Followed cattle path + cut a low of corn over but saw nothing but visible limestone outcrops. Then crossed an unnamed quebrada (not very deep)

1920-01-07

but by and through relatively flat area to  
S. + W. of that several small. The vegetation  
here has been recently cleared + the ground  
surface is well as most areas. There are  
deserted quite well on the E. edge of the flat  
area S. of the quebrada, really just a thin  
hush, but nothing else. Did we what looked  
like a fragment of what but not worked.  
The water found.

As the exposure of the aforementioned glacial  
thrust, no sign of water up here. The soil is a  
dark black (it rained about 24 hrs ago)  
broken repeatedly by outcrops of limestone.  
A hole a few, widely dispersed pieces of other  
stones were noted, they are very rare. Everywhere  
there are grey to white limestone boulders  
thrusting up -- at least I looked like a  
rationally found out block.

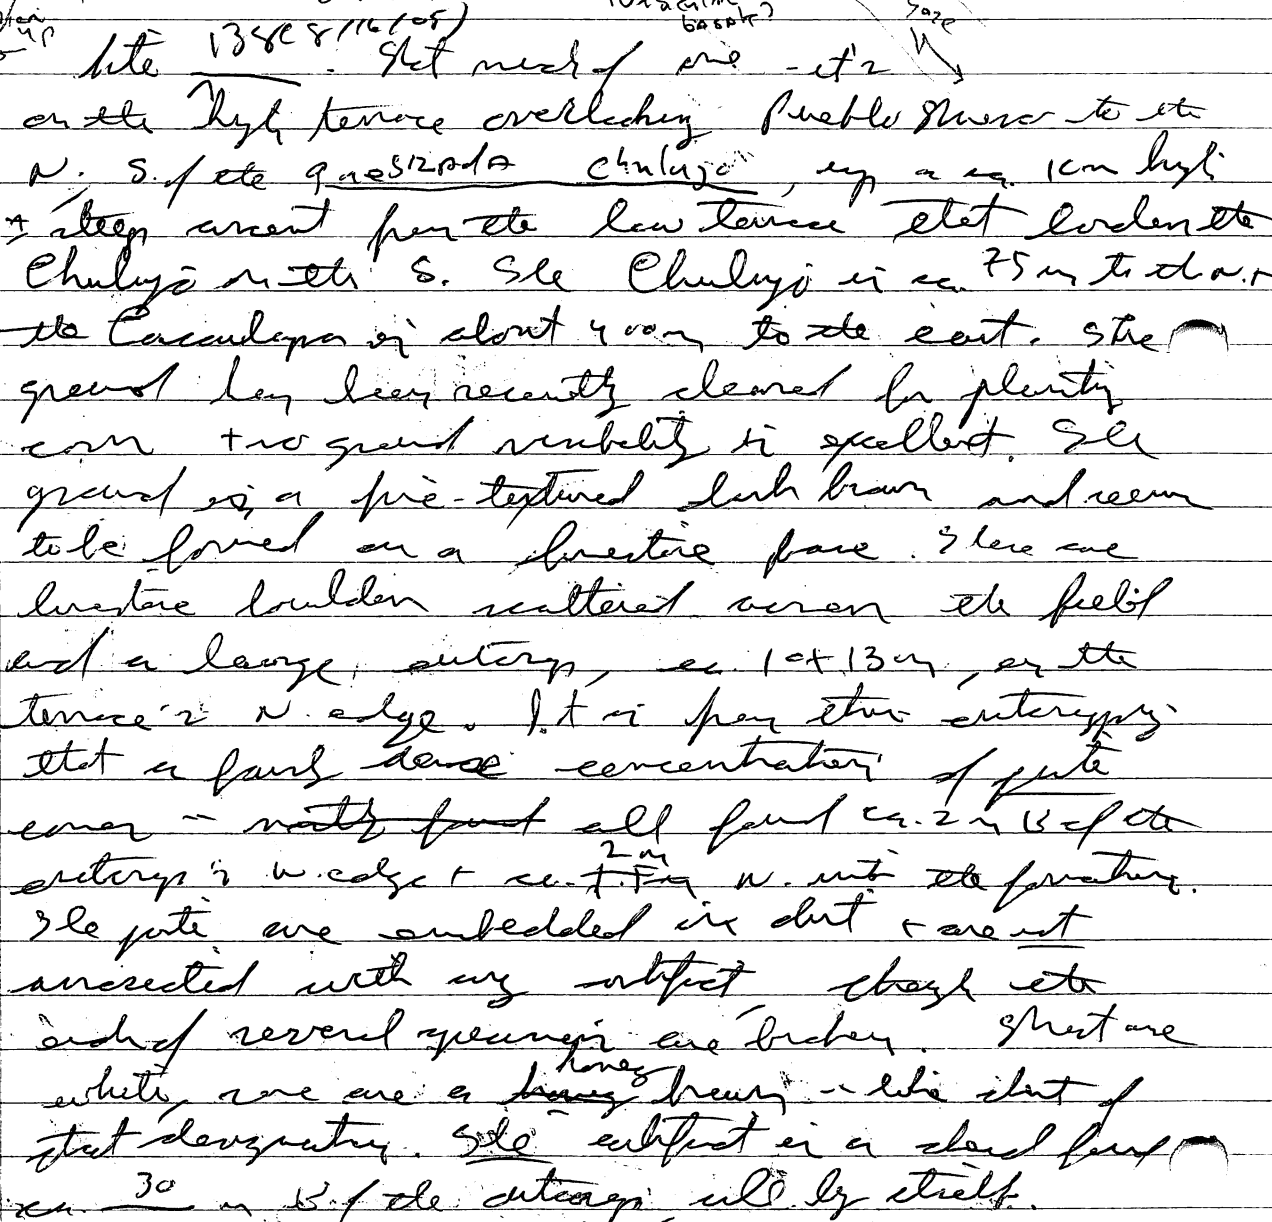

Again, the land we walked along  
to quebrada also been burnt recently. One  
of the limestone or chert black bone when  
I'm searching for signs that the soil is  
fairly thin but good for growing maize.  
The rocks seem to reduce the attractiveness of  
this area for farming -- the hilltop is used  
for poor cattle pasture now but could be planted.  
Not so good I imagine if you have a dry year.

The topography up here is more complex than the  
map indicates. It looks like a flat land sloping up to  
the SW. towards the peak (which we did not  
ascend) is generally accurate but quebrada  
divide + almost the towards creating + isolated  
hilltops. The N. part of this, then look like a small

on the high terrace overlooking Pueblo Nuevo to the  
N. S. of the quartzite chert, up a ca. 10m high  
steep ascent from the low terrace that borders the  
Chulys with S. The Chulys is ca. 75m to the N. of  
the Cascadilla is about 400m to the east. The  
ground has been recently cleared for planting  
corn + no ground visibility is excellent. The  
ground is a fine-textured dark brown and seems  
to be formed on a limestone base. There are  
limestone boulders scattered across the field  
and a large outcrop, ca. 10 x 13m, on the  
terrace's N. edge. It is from this outcrop  
that a fairly dense concentration of quartz  
concentrations - mostly from all found ca. 2m N. of the  
outcrop's W. edge + ca. 1.5m N. into the formation.  
The quartz are embedded in dirt + are not  
associated with any subject chert into  
which of several quarries are broken. There are  
white, some are a <sup>honey</sup> brown - like that of  
that quartzite. The outcrop is a sandstone  
ca. 30m N. of the outcrop, all by itself.

See line of the hill ca. 25 m back S/SW of  
the outcrop. Just - I just can't make it  
outcrop into a body.

P 2001-01-05

Site 138 (cont.)

Basically, it looks like material eroding out of the terrace edge. One additional note near base of between the limestone outcrop & the "stone line".

The stone line is about 1.8m long E-W. (300°) by 0.4m N-S. (toward the stone). I'd see it as one outcrop except the rock comprising it are distinct & (seems to be) peculiar basalt which does not seem to outcrop noticeably on the terrace. The rest of the rock looks like limestone, see case 4. Could be part of a structure?

Limestone continues to appear on the N. terrace face E of the outcrop but not as densely as in the outcrop itself.

Rock looks like a fairly dispersed into, possibly little (based on the photo -- the 1st is not so typically diagnostic), w/ no substantial architecture, if any. A continuation of El Cuyote?

I have been thinking much lately about the future of our country. I feel that we are at a critical juncture, and it is up to us to decide whether we will continue down the path of division and discord, or if we will unite and work together for the common good.

Accessed into location on a ca. 2.5m high  
terrace above & about 125m S of the previous  
settlement. To the left here are the remains of  
1st. seemingly flattered by trees & some  
low 0.2m high narrow cobbles scattered  
eroded shrubs. Some great conifers, pine,  
& cypripedium, undergrowth. The diameter of this block is ca. 6m.  
The slope must have been heavily incised  
the low line rear.

7

Accessed 3rd into, ca. 175m S of the last  
locus & around a low (ca. 10m high) rounded hill  
from the latter. Still the same veg, cypripedium &  
several topographic situations.

748 ft.

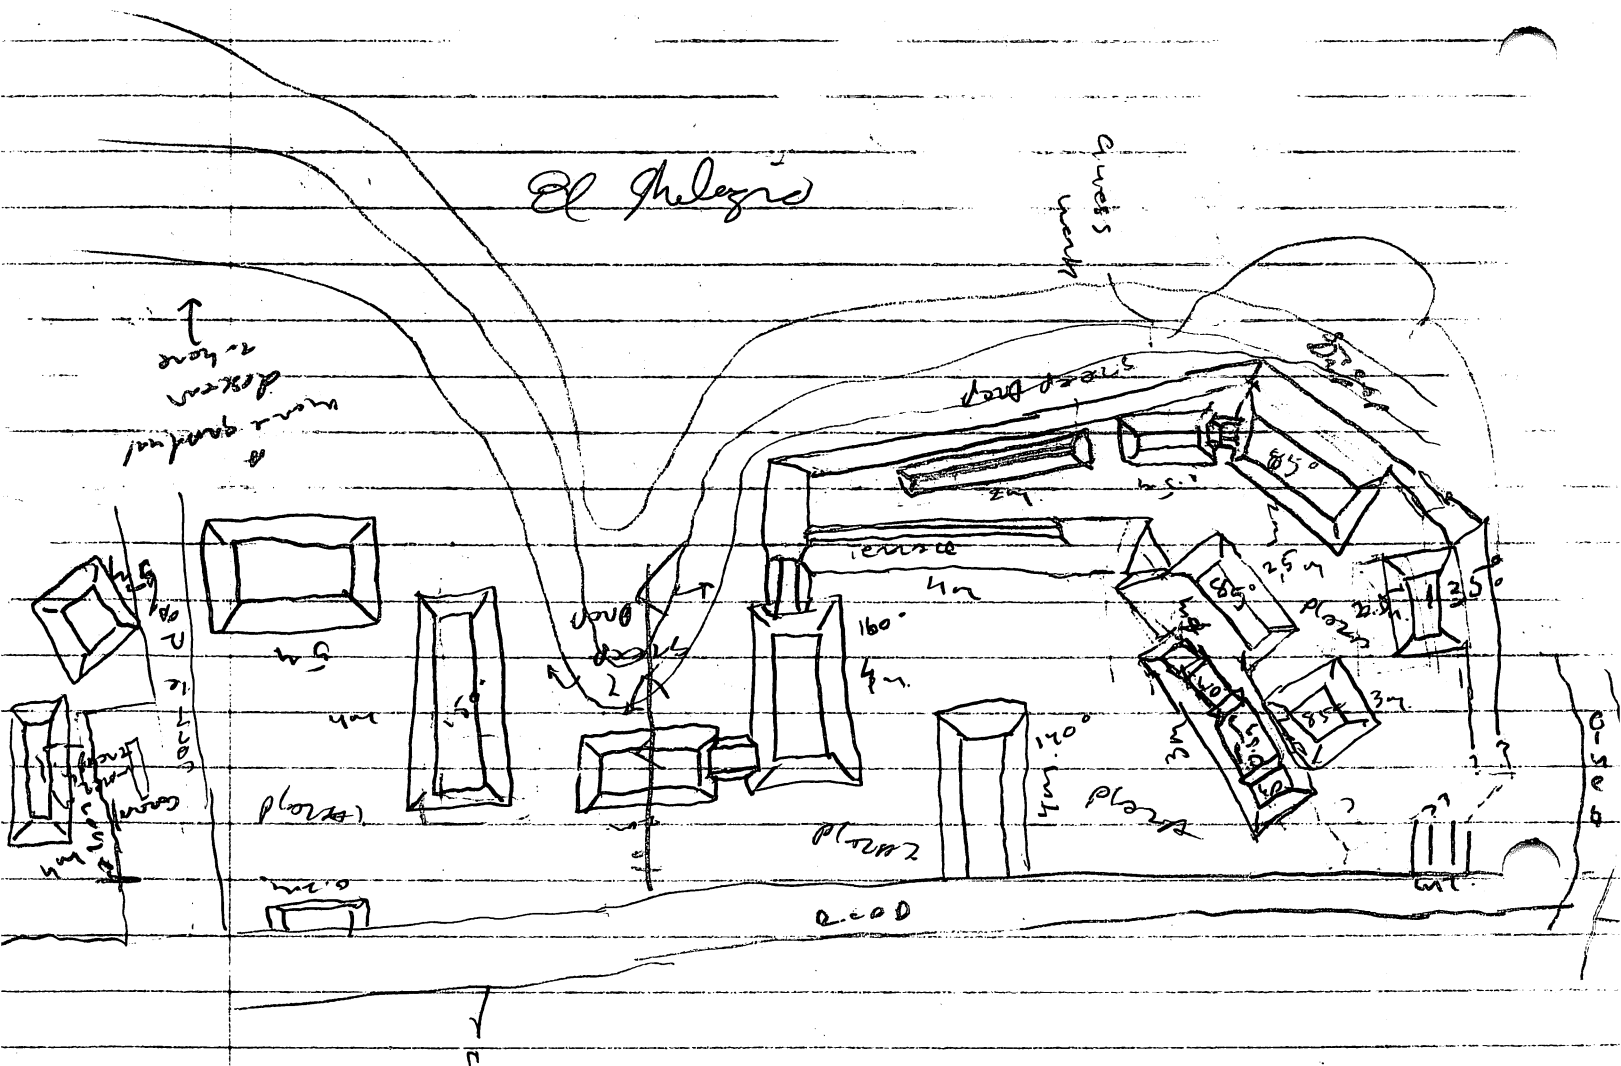

Good ground visibility. Site -- the real  
ground here shows up nicely, especially the  
further S + B. zone around the hill. Some  
Culicidaria ca. 120' from the site. The ground  
slopes down gradually from the low (10m high) hill  
ca 50m to the NW + hill to the W.

(ca. 200m) to the ESE. Hill of  
seems to have a small white

see sketch of 7/27/01

She went for the S., especially in the area of the main stn, in charact. & the bldgs. seem to have been set to take adv of the natural topography. She was "simplistic" in quite complex and I'm pretty certain that I've over-simplified it, if not misrepresented the arrangement completely. She leaves out the stn of these gray in put pure greenish. Looks like a series of various planes defined by large construction set out in an 8-m. line.

7 Here we ~~go~~ go again. This one is just on the  
other (B NE) side of the low (in 2m high) hill with the  
cliff at the end of the road on which the previous  
site was located. This one has 3 stars set into the  
B side of a low (2m high) hill with the hill  
clay off the W. side of the slope. The ground  
drops off gradually to the N. into a  
narrow valley bottom - a creased crevice.  
250m to the N. Same ownership, same survey &  
land use as before. There are reported to be  
areas of mud soil - intermixed ridges. The  
soil still shows up more. New collar, the 1-  
dial is from O. Bradley  
at the summit  
from the W. side

W 088° 19' 800'

Shulogani ca. 150 m

E of the Quebrada Calabaza + creek by marshy to the S. a "puente de agua". The Calabaza is running up water at this pt. while further S. in the same it is dry. The site is overgrown w/ cane + brush -- the B. - not bldgs. are clear - the fec. bldgs. are on the E. border of the site while the Q. bldgs. Calabaza closer to the W. side.

It's never colder.

I tried hard to tell the farm at this pt. -- while N. of the road is completely covered in dense cane while on the S. it's still hard to see the pullover beneath the brush.

The sketch says only goes for Giovanni's house to the Q. bldgs. Calabaza on the S. side of the road -- the site almost certainly continues as of the road, but as I saw vaguely without the outline of the site. It may continue E. past the fec. bldgs. -- they seem to be forming a river in this area for clay to make adobe bricks but it's not clear that this is a str. -- It could be a natural river -- I didn't find the river at this pt. in Giovanni's field we saw some but a bit sandy about people on their property -- Giovanni walked around w/ us while we made our tour.

Quite an impressive locale -- the land slopes down dramatically to the S. into a "puente de agua".

P201-01-11

W. N. Chappell? (8/16/05)  
7/24/01

after lunch -- drove w. of the Guera  
Candaya st. dipmer 'Luz 7 serenos' sled well  
on the w. -- about 4500m w. of the Gher +  
S. of the road to Luz Sharcon. This is very  
strange -- widely shaped stony out of  
clay, 2-5m high, spread out on both  
sides (w. + S.) of the S.W. - S.E. road. The site  
extends for about 500m on both sides of  
the thoroughfare, covering ca 1 km<sup>2</sup>. The S. side  
is in a car field + so there were probably  
more stn. here originally -- hard to see  
anything but the tallest. On the w. there  
has been plowing in well but the land  
there seems to be devoted to mango.

Property of 7 serenos' G. andal of SPS.

The land is flat but slopes down  
gradually from S.W. towards the bordering  
hills (ca. 400m distant) towards the Mi  
Chunalecan.

S. pt. N 15° 18.1386' 768'  
W 088° 21.997'

Actually, this S. pt. seems to be on the  
N. - west of 2 low hills (ca. 8m high) that  
"look like" mch. but are, in fact, natural in  
evidence of the presence of mica. not rocks  
interlying on their surface. There is a road, <sup>(3m high)</sup> having  
about 35m to the ~~road~~ N. of these hills and  
another (ca. 6m high) roughly 110m to the N.E.

There are cobbles scattered to the east of the  
shanty, suggesting the main source of stone  
here. This presumption is supported by local  
reports of the local geology and recovery  
of mica from the area. The road is necessary to get

PVC  
145  
(8/16/05)

not as much as the earth around sites 3+4.  
Collected a red tile from near the pea bldg. on the  
E. side of the camp field + found it sparkling  
new. It looks like this area might  
have been the source of the CCV's + possibly  
Glenn's meacassin shaver.

The soil around El Molagui also sparkled  
w/ mica, but here no clay around sites 3+4 --  
appears that there's no mica the closer you get  
to the hills.

Several of the "sites" featuring the same flat  
seen to be natural hills, enriched by the  
presence / enlargement of meacassin (red clay  
etc.) enriched culturally (enriched by  
surging quantities of river cobbles etc.  
around them). The site's degraded appearance  
may be due to the enthusiasm to use natural  
emersion in "sites". No subjects were noted.  
Much of the country was covered by, especially  
around these margins, making it difficult to  
obtain orientation.

On the camp field N. of the road -- still  
the Stadel property. This field is nearly  
plowed + we're arching a surface collector, most  
of the artifacts being concentrated in the N.E. corner  
of the field ca. 15m N.E. of the surviving site,  
of which remnant of by all showed around  
their edges made of river cobbles. There are  
not the culturally enriched hills found to  
the S. ca. 400m S. to be expensive while  
seemingly to be elsewhere. The soil is black +  
not meacassin, though the shad seems to  
be mica-rich.
