Fragment of a figurine. There is a firecore that extends through out the fragment. The fragment is solid. There is no fire clouding or exterior burning. Hardness = 2.7. The surface is bumpy, but fairly compacted, as if portions of it had been smoothed. The design elements include a rounded, bulging protuberance with two holes pushed into it. They appear to have been made by a hollow cylinder. The bulb is 1.7 cm wide and extends 1 cm from the remainder of the fragment. It was probably applied, and a small ^{incised} groove separates it from the remainder of the fragment. There are also incisions radiating outward from the protrusions which extend intermittently around the entire protuberance.
