CATALOG NUMBER: PSB 106P/1-3a, b

SUBSTANCE: ceramic

OBJECT: Censlo staphanide

CAT. NUMBER

PSB 106P

106P/1-3a, b

PSB 106P/1-3a, b

1-3a is basically a rectangular shape - The top surface of which is smooth. The parallel surface - the back has a oval shaped feature which sticks out from the back side and is located ~~to~~ on one side of the fragment and extends to one of the edges. - given that the smooth surface is running on a frontal plane - the edges that run on the sagittal plane - one is smooth and worn - but it still appears to have been a bead. Here the firing core is visible - and seems to take up most of what consists of the fragment - the outer layer appears to be about 1cm thick outside of core. The other edge running on the sagittal plane is a more definite break & does not expose the firing core. The edges running across the transverse plane are rounded and smooth on the portions closest to the side of the fragment where the ovalular feature is located. The other portions of these edges are clipped - and the rounded surface is therefore missing. The 1-3b piece - is smaller than 1-3a. It resembles a parallelogram in its shape. There are 2 smooth finished surfaces - they are parallel to one another - and run along the frontal plane - a portion of one of the edges running along the transverse plane is still smooth and round - the rest of that edge and the edge connect along the beak that run on the sagittal plane. Both the edges that connect do not reveal the firing core - which is a charcoal gray color. While the parallel edges do reveal the firing core. The firing core on 1-3b is similar to 1-3a - except that more of the outer surface is visible in the area of the firing core. There are white and silver specks throughout the surface - fine paste.
